

CLAIMS

1. A multicarrier communication apparatus comprising:

converting means for converting a single
5 information signal stream to a plurality of streams of
information signals;

generating means for generating a multicarrier
signal by superimposing a plurality of streams of
information signals respectively on stream-specific
10 carrier waves;

peak power detecting means for detecting peak power
of said multicarrier signal; and

re-generating means for, when said peak power
exceeds a threshold value, superimposing a signal for
15 suppressing peak power instead of an information signal
on a specific carrier wave among said carrier waves and
re-generating the multicarrier signal at the time said
peak power exceeded the threshold value.

20 2. The multicarrier communication apparatus according
to claim 1, wherein (:) said converting means executes
error correction coding processing on an information
signal of a predetermined stream among said plurality
of streams of information signals; and

25 said generating means superimposes the information
signal of each stream subjected to error correction coding
processing on a stream-specific specific carrier wave.

3. The multicarrier communication apparatus according to claim 1, wherein said re-generating means uses at least one carrier wave selected from among all carrier waves
5 as a specific carrier wave.

4. The multicarrier communication apparatus according to claim 1, wherein said re-generating means uses a random signal as a signal for suppressing peak power.
10

5. The multicarrier communication apparatus according to claim 1 wherein:

said re-generating means uses a signal for which amplitude and phase are limited as a signal for suppressing
15 peak power; and

said re-generating means comprises storing means for storing multicarrier signal generation results computed beforehand, and re-generates a multicarrier signal using said stored generation results.
20

6. The multicarrier communication apparatus according to claim 1, wherein said re-generating means uses a signal for which amplitude is generally zero as a signal for suppressing peak power.
25

7. The multicarrier communication apparatus according to claim 1, further comprising clipping means for

performing clipping processing on a multicarrier signal for which peak power exceeds a threshold value among multicarrier signals generated by said generating means.

- 5 8. A communication terminal apparatus provided with a multicarrier communication apparatus, said multicarrier communication apparatus comprising:

converting means for converting a single information signal stream to a plurality of streams of information signals;

generating means for generating a multicarrier signal by superimposing a plurality of streams of information signals respectively on stream-specific carrier waves;

15 peak power detecting means for detecting peak power of said multicarrier signal; and

re-generating means for, when said peak power exceeds a threshold value, superimposing a signal for suppressing peak power instead of an information signal on a specific carrier wave among said carrier waves and re-generating the multicarrier signal at the time said peak power exceeded the threshold value.

- 25 9. A base station apparatus provided with a multicarrier communication apparatus, said multicarrier communication apparatus comprising:

converting means for converting a single

information signal stream to a plurality of streams of information signals;

generating means for generating a multicarrier signal by superimposing a plurality of streams of information signals respectively on stream-specific carrier waves;

peak power detecting means for detecting peak power of said multicarrier signal; and

re-generating means for, when said peak power exceeds a threshold value, superimposing a signal for suppressing peak power instead of an information signal on a specific carrier wave among said carrier waves and re-generating the multicarrier signal at the time said peak power exceeded the threshold value.

10. A multicarrier communication method comprising:

a converting step of converting a single information signal stream to a plurality of streams of information signals;

a generating step of generating a multicarrier signal by superimposing a plurality of streams of information signals respectively on stream-specific carrier waves;

a peak power detecting step of detecting peak power of said multicarrier signal; and

a re-generating step of, when said peak power exceeds a threshold value, superimposing a signal for suppressing
